

**Key:**

StrataBit Capsheet

StrataBase Underlay

Strata Angle Fillet

**Construction Notes:**

If required, use a timber board as a cavity closure on top of the parapet wall.

Use a strip of StrataBit Capsheet and StrataBase Underlay to bring up and over the parapet wall as indicated. Ensure all waterproofing terminates a min. 150mm above the finished roof level.

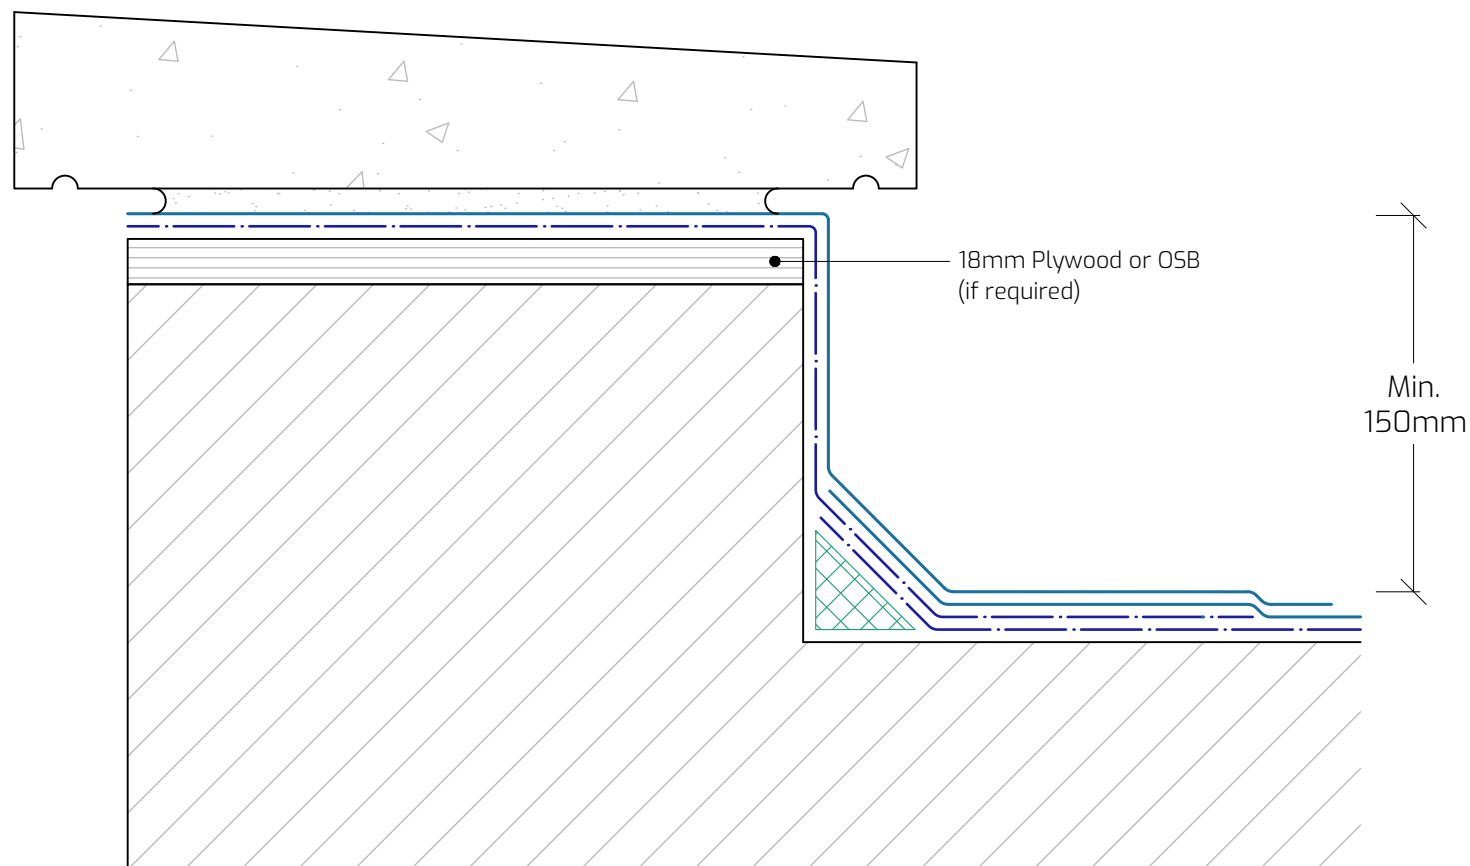

The coping stone should project a min. 45mm beyond the faces of the wall and incorporate a drip at least 30mm from the face of the wall to stop water running back under the coping.

Any upstand in excess of 250mm should be mechanically fixed at the leading edge with appropriate fasteners in order to avoid slippage of the waterproofing membrane.

The system build-up and application should adhere to the STRATA issued specification.

All surfaces must be clean, dry, and suitably prepared to accept the waterproofing system.

All details should be installed in full compliance with the most up-to-date NHBC Standards, BS 8217, BS 6229, and STRATA recommendations.
